

## The Water Cycle - A Little Book

Water moves around our planet in a big circle called the water cycle.

The sun heats up water in oceans, lakes, and rivers.

The warm water turns into an invisible gas called water vapor.

This step is called evaporation.

High up in the sky, the air is very cold.

The water vapor cools down and turns into tiny water drops.

The tiny drops stick together and make clouds.

This step is called condensation.

When clouds get heavy, the water falls back down.

It can fall as rain, snow, or hail.

This step is called precipitation.

The water flows back into rivers, lakes, and oceans.

Then the whole cycle starts again, around and around!
